

Game Theory Explorer - Software for the Applied Game Theorist

Bernhard von Stengel

**Department of Mathematics
London School of Economics**

July 2013

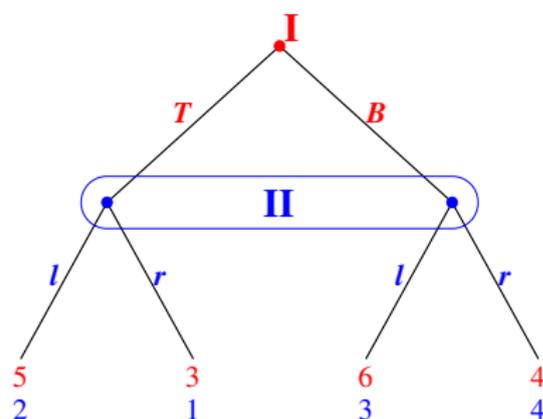

Overview

Explain and demonstrate GTE (Game Theory Explorer),
open-source software, **under development**, for
creating and analyzing non-cooperative **games**

in strategic form:

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	2 5	1 3
	<i>B</i>	3 6	4 4

and extensive form:

Intended users

Applied game theorists:

- experimental economists (analyze game before running experiment)
 - game-theoretic modelers in biology, political science, ...
 - in general: non-experts in equilibrium analysis
- ⇒ design goal: **ease of use**

Researchers in game theory:

- testing conjectures about equilibria
- as contributors: designers of game theory algorithms

History: Gambit

GTE now part of the **Gambit** open-source software development,
<http://www.gambit-project.org>

2011 and 2012 supported by **Google Summer of Code (GSoC)**

Gambit software started ~1990 with **Richard McKelvey** (Caltech) to analyze games for **experiments**, developed since 1994 with **Andy McLennan** into C++ package, since 2001 maintained by **Ted Turocy** (Norwich, UK).

- Gambit must be **installed** on PC/Mac/Linux, with GUI (graphical user interface) using platform-independent wxWidget
- has collection of algorithms for computing Nash equilibria
- offers **scripting language**, now developed using Python

Features of GTE

GTE independent **browser-based** development:

- no software installation needed, low barrier to entry
- nicer GUI than Gambit
- export to graphical formats

Features of GTE

GTE independent **browser-based** development:

- no software installation needed, low barrier to entry
- nicer GUI than Gambit
- export to graphical formats

Disadvantages:

- manual storing / loading of files for security reasons
- long computations require local server installation (same GUI)

Features of GTE

GTE independent **browser-based** development:

- no software installation needed, low barrier to entry
- nicer GUI than Gambit
- export to graphical formats

Disadvantages:

- manual storing / loading of files for security reasons
- long computations require local server installation (same GUI)

Contributors:

David Avis (**Irs**), Rahul Savani (PhD 2006), Mark Egesdal (2011), Alfonso Gomez-Jordana, Martin Prause (**GSoC 2011, 2012**)

Example of a game

2×2 game in strategic form:

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	5, 2	3, 1
	<i>B</i>	6, 3	4, 4

Example of a game

2×2 game in strategic form:

		II	
		<i>l</i>	<i>r</i>
I	T	5 2	3 1
	B	6 3	4 4

with pure best responses

Example of a game

2×2 game in strategic form:

		II	
		0	1
I	0 T	5, 2	3, 1
	1 B	6 , 3	4 , 4
		<i>l</i>	<i>r</i>

with pure best responses
and equilibrium probabilities

Extensive (= tree) form of the game

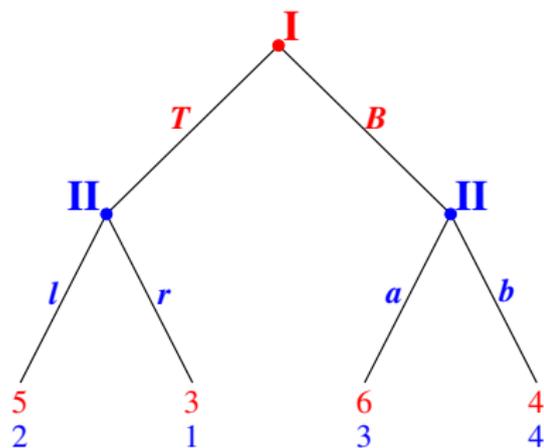

Players move sequentially,

information sets show **lack of information** about game state:

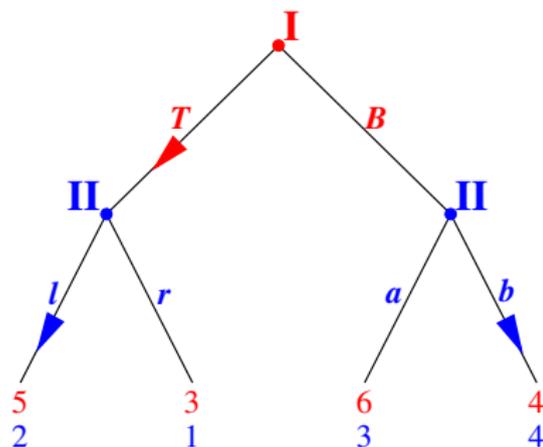

Commitment (leadership) game

Changed game when **player I** can commit:

Commitment (leadership) game

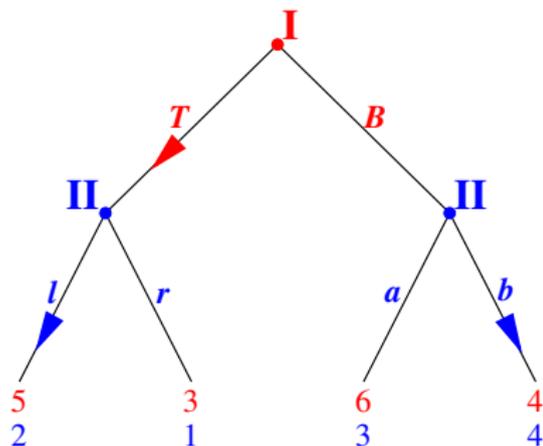

Changed game when **player I** can commit:

Subgame perfect equilibrium: (**T**, **l-b**)

Commitment (leadership) game

Changed game when **player I** can commit:

		II			
		$l-a$	$l-b$	$r-a$	$r-b$
I	T	5, 2	5, 2	3, 1	3, 1
	B	6, 3	4, 4	6, 3	4, 4

Subgame perfect equilibrium: $(T, l-b)$

Commitment (leadership) game

Changed game when **player I** can commit:

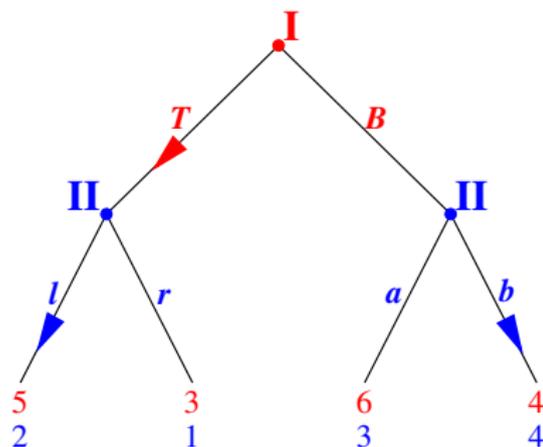

Subgame perfect equilibrium: $(T, l-b)$

		II			
		$l-a$	$l-b$	$r-a$	$r-b$
I	T	5, 2	5, 2	3, 1	3, 1
	B	6, 3	4, 4	6, 3	4, 4

Commitment (leadership) game

Changed game when **player I** can commit:

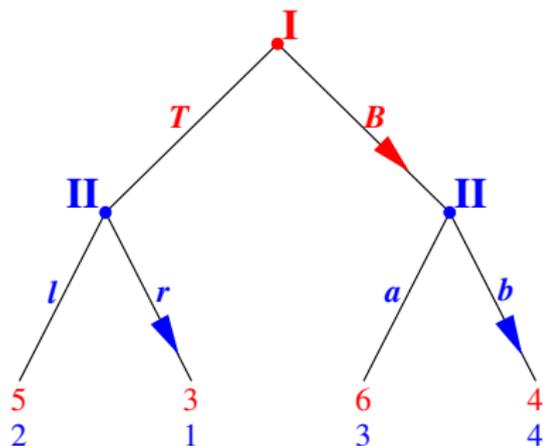

Subgame perfect equilibrium: (**T**, **l-b**)

		II			
		<i>l-a</i>	<i>l-b</i>	<i>r-a</i>	<i>r-b</i>
I	1 T	5, 2	5, 2	3, 1	3, 1
	0 B	6, 3	4, 4	6, 3	4, 4

Commitment (leadership) game

Changed game when **player I** can commit:

		II			
		$l-a$	$l-b$	$r-a$	$r-b$
I	0 T	$\boxed{2}$ 5	$\boxed{2}$ $\boxed{5}$	1 3	1 3
	1 B	$\boxed{6}$ 3	4 $\boxed{4}$	$\boxed{6}$ 3	$\boxed{4}$ $\boxed{4}$

Subgame perfect equilibrium: $(T, l-b)$

Other equilibria: $(B, r-b)$

Commitment (leadership) game

Changed game when **player I** can commit:

		II			
		$l-a$	$l-b$	$r-a$	$r-b$
I	0 T	5, 2	5, 2	3, 1	3, 1
	1 B	6, 3	4, 4	6, 3	4, 4

Subgame perfect equilibrium: $(T, l-b)$

Other equilibria: $(B, r-b)$, $(B, \frac{1}{2}l-b \frac{1}{2}r-b)$

Commitment (leadership) game

Changed game when **player I** can commit:

		II			
		$l-a$	$l-b$	$r-a$	$r-b$
I	1 T	5, 2	5, 2	3, 1	3, 1
	0 B	6, 3	4, 4	6, 3	4, 4

Subgame perfect equilibrium: $(T, l-b)$

Other equilibria: $(B, r-b)$, $(B, \frac{1}{2}l-b \frac{1}{2}r-b)$, $(T, \frac{1}{2}l-a \frac{1}{2}l-b)$

GTE output for the commitment game

2 x 4 Payoff player 1

	l-a	l-b	r-a	r-b
T	5	5	3	3
B	6	4	6	4

2 x 4 Payoff player 2

	l-a	l-b	r-a	r-b
T	2	2	1	1
B	3	4	3	4

EE = Extreme Equilibrium, EP = Expected Payoffs

Rational:

EE 1 P1: (1) 0 1 EP= 4 P2: (1) 0 1/2 0 1/2 EP= 4
 EE 2 P1: (1) 0 1 EP= 4 P2: (2) 0 0 0 1 EP= 4
 EE 3 P1: (2) 1 0 EP= 5 P2: (3) 0 1 0 0 EP= 2
 EE 4 P1: (2) 1 0 EP= 5 P2: (4) 1/2 1/2 0 0 EP= 2

Connected component 1:

{1} x {1, 2}

Connected component 2:

{2} x {3, 4}

Demonstration of GTE

Preceding games:

- 2×2 game in strategic form
- extensive form of that game
- commitment game, extensive and strategic form

Demonstration of GTE

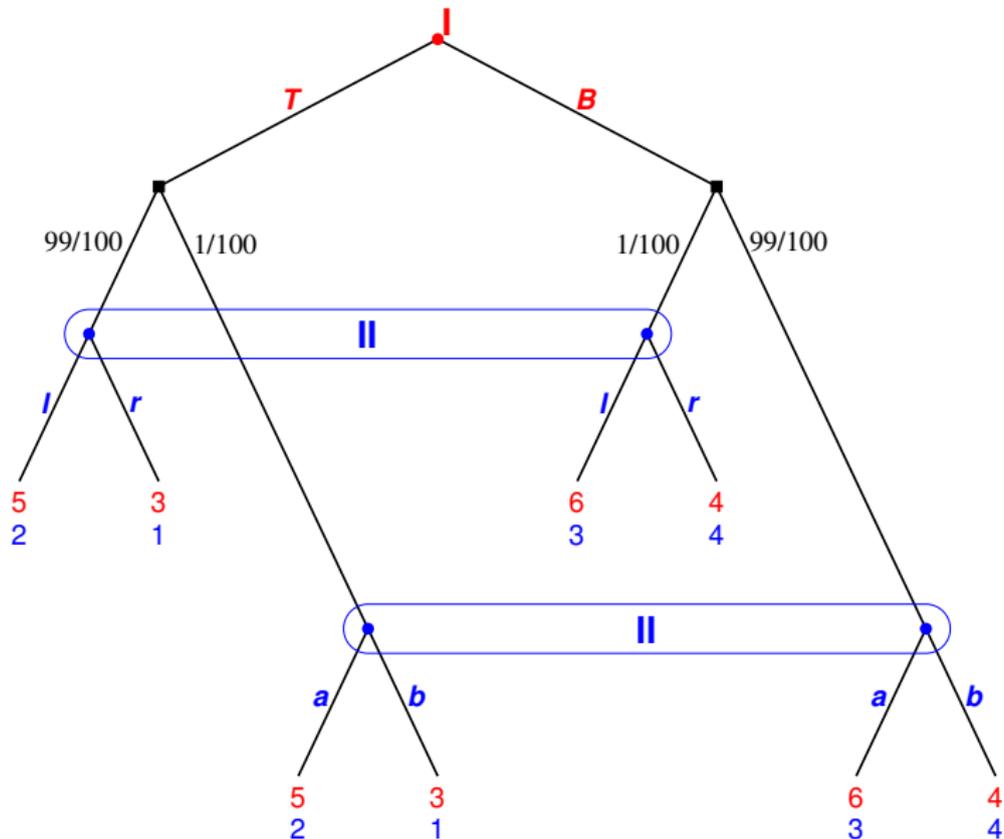

Preceding games:

- 2×2 game in strategic form
- extensive form of that game
- commitment game, extensive and strategic form

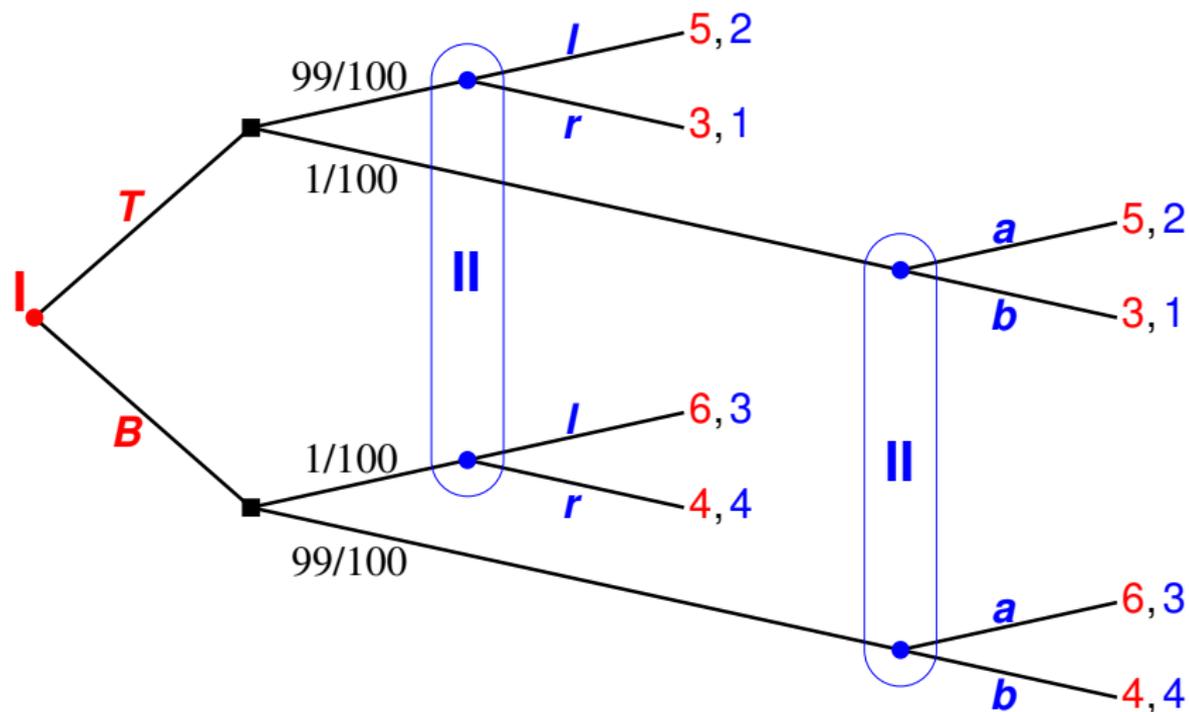

Next: create from scratch a more complicated extensive game

- imperfectly observable commitment

Game with imperfectly observable commitment

Game tree drawn left to right

GTE output for imperfectly observable commitment

2 x 4 Payoff player 1

	l-a	l-b	r-a	r-b
T	5	249/50	151/50	3
B	6	201/50	299/50	4

2 x 4 Payoff player 2

	l-a	l-b	r-a	r-b
T	2	199/100	101/100	1
B	3	399/100	301/100	4

EE = Extreme Equilibrium, EP = Expected Payoffs

Decimal:

EE 1 P1: (1) 0.01 0.99 EP= 4.0102 P2: (1) 0 0.5102 0 0.4898 EP= 3.97
 EE 2 P1: (2) 0 1.0 EP= 4.0 P2: (2) 0 0 1.0 EP= 4.0
 EE 3 P1: (3) 0.99 0.01 EP= 4.9898 P2: (3) 0.4898 0.5102 0 0 EP= 2.01

Connected component 1:

{1} x {1}

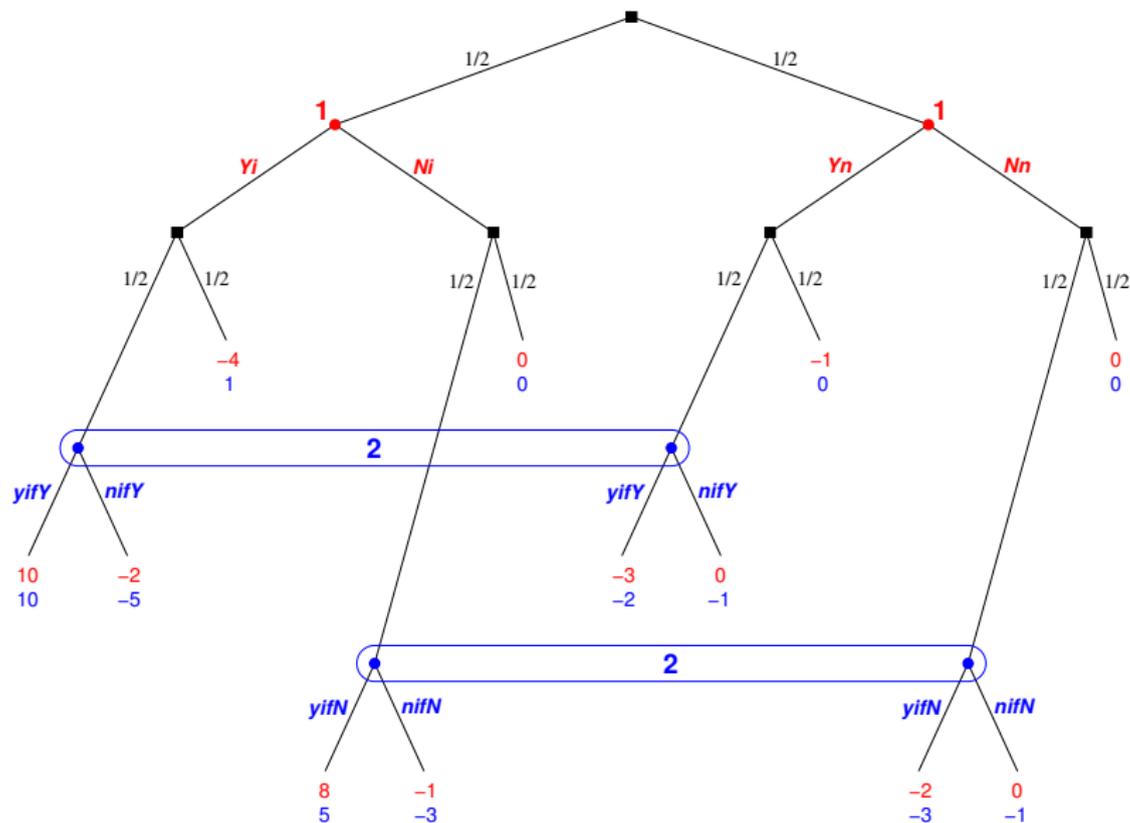

Connected component 2:

{2} x {2}

Connected component 3:

{3} x {3}

More complicated signaling game, 5 equilibria

Some more strategic-form games

For studying more complicated games:

generate game matrices as text files, copy and paste into strategic-form input.

Future extension:

Automatic generation via command lines or “worksheets” for scripting, connection with Python and Gambit

GTE software architecture

Client (your computer with a browser):

- GUI: JavaScript (Flash's variant called ActionScript)
- store and load game described in XML format
- export to graphic formats (.png or XFIG → EPS, PDF)
- for algorithm: send XML game description to server

GTE software architecture

Client (your computer with a browser):

- GUI: JavaScript (Flash's variant called ActionScript)
- store and load game described in XML format
- export to graphic formats (.png or XFIG → EPS, PDF)
- for algorithm: send XML game description to server

Server (hosting client program and equilibrium solvers):

- converts XML to Java data structure (similar to GUI)
 - solution algorithms as binaries (e.g. C program **lrs**), send results as text back to client
- ⇒ cannot use restrictive public servers like “Google App Engine”

High usage of computation resources

Finding all equilibria takes exponential time

⇒ for large games, server should run on your computer, not a public one

achieved by local server installation (“Jetty”), requires installation, but offers same user interface.

Algorithm: Finding all equilibria

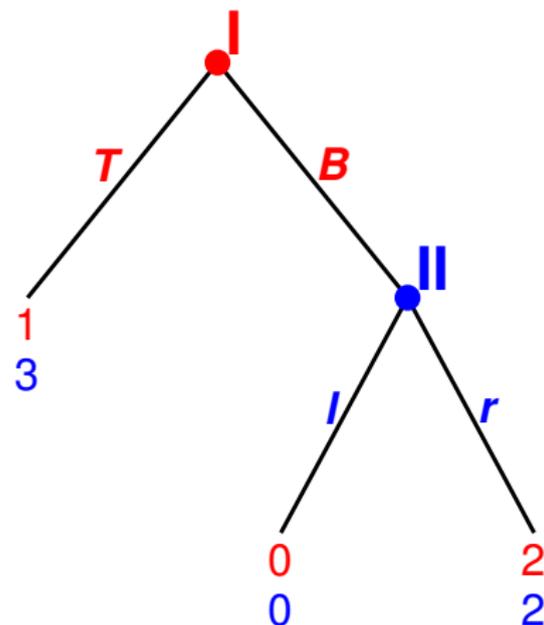

For two-player games in strategic form, all Nash equilibria can be found as follows:

- payoffs define inequalities for “best response polyhedra”
- compute **all vertices** of these polyhedra (using **lrs** by David Avis, requires arbitrary precision integers)
- match vertices for **complementarity** (LCP)
- find maximal **cliques** of matching vertices for equilibrium **components**

Example

I \ **II**
T *l* *r*
B

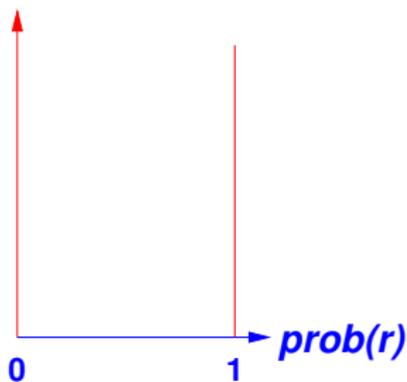

1	3	1	3
0	0	2	2

Best response polyhedron of player I

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	<div style="border: 1px solid red; display: inline-block; padding: 2px;">1</div> <div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">3</div>	<div style="border: 1px solid red; display: inline-block; padding: 2px;">1</div> <div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">3</div>
	<i>B</i>	<div style="border: 1px solid red; display: inline-block; padding: 2px;">0</div> <div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">0</div>	<div style="border: 1px solid red; display: inline-block; padding: 2px;">2</div> <div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">2</div>

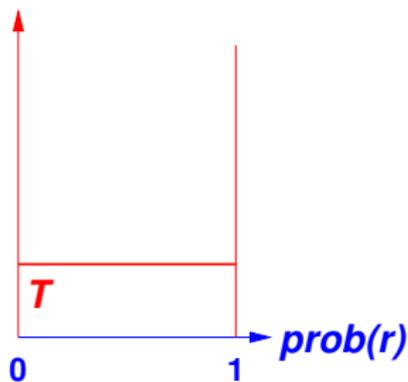

payoff player I

Best response polyhedron of player I

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	1 3	1 3
	<i>B</i>	0 0	2 2

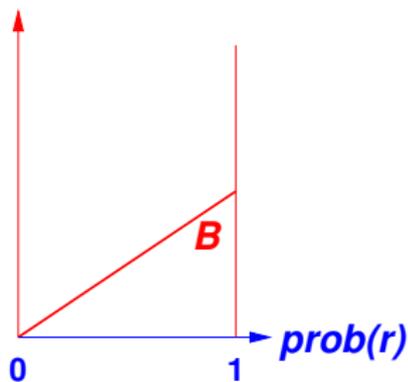

payoff player I

Best response polyhedron of player I

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	<div style="border: 1px solid red; display: inline-block; padding: 2px;">1</div> <div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">3</div>	<div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">3</div>
	<i>B</i>	<div style="border: 1px solid red; display: inline-block; padding: 2px;">0</div> <div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">2</div>	<div style="border: 1px solid red; display: inline-block; padding: 2px;">2</div> <div style="border: 1px solid blue; display: inline-block; padding: 2px; margin-left: 10px;">2</div>

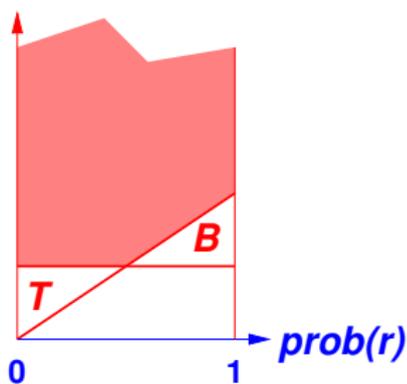

payoff player I

Best response polyhedron of player I

		<i>l</i>	<i>r</i>
I	<i>T</i>	<div style="border: 1px solid red; padding: 2px;">1</div> <div style="border: 1px solid blue; padding: 2px; background-color: #d9e1f2;">3</div>	<div style="border: 1px solid blue; padding: 2px; background-color: #d9e1f2;">3</div>
	<i>B</i>	<div style="border: 1px solid blue; padding: 2px; background-color: #d9e1f2;">0</div>	<div style="border: 1px solid red; padding: 2px;">2</div> <div style="border: 1px solid blue; padding: 2px; background-color: #d9e1f2;">2</div>

payoff player I

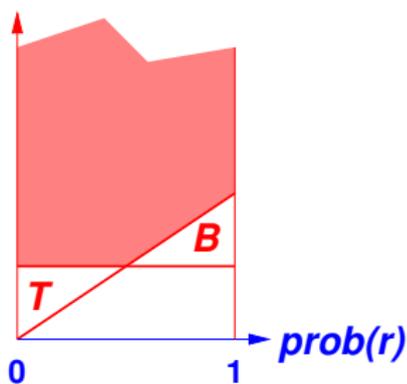

payoff player II

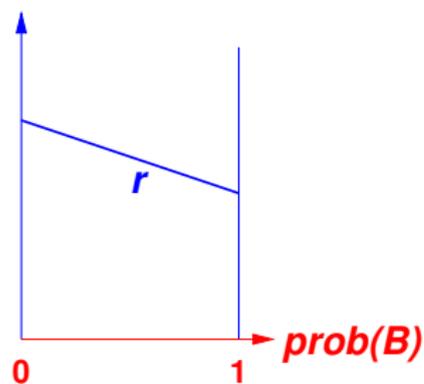

Best response polyhedron of player II

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	<div style="border: 1px solid red; padding: 2px;">1</div> <div style="border: 1px solid blue; padding: 2px; margin-left: 20px;">3</div>	<div style="border: 1px solid red; padding: 2px;">1</div> <div style="border: 1px solid blue; padding: 2px; margin-left: 20px;">3</div>
	<i>B</i>	<div style="border: 1px solid red; padding: 2px;">0</div> <div style="border: 1px solid blue; padding: 2px; margin-left: 20px;">0</div>	<div style="border: 1px solid red; padding: 2px;">2</div> <div style="border: 1px solid blue; padding: 2px; margin-left: 20px;">2</div>

payoff player I

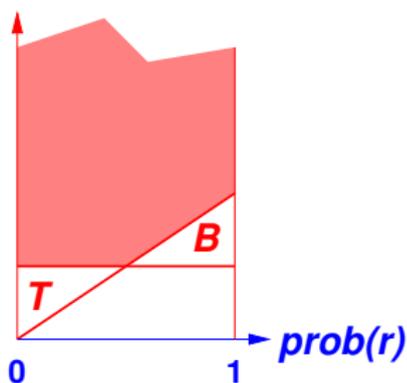

payoff player II

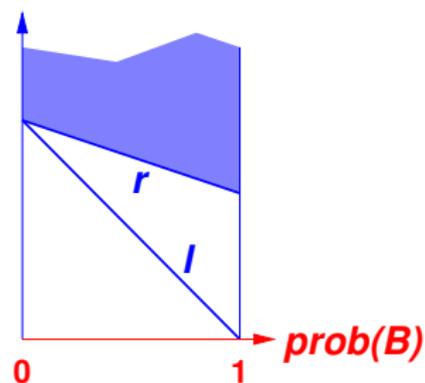

Best response polyhedron of player II

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	1 , 3	1, 3
	<i>B</i>	0, 0	2 , 2

payoff player I

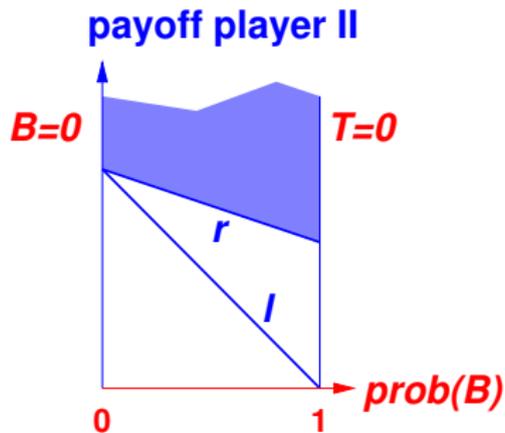

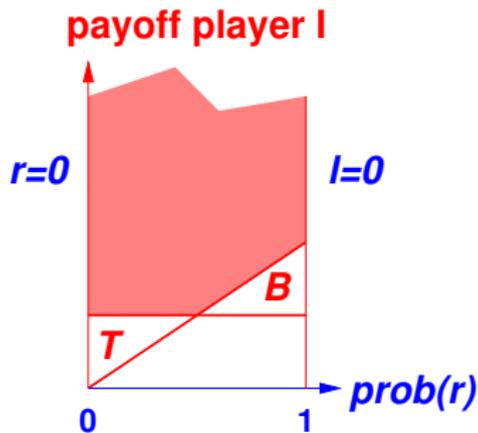

payoff player II

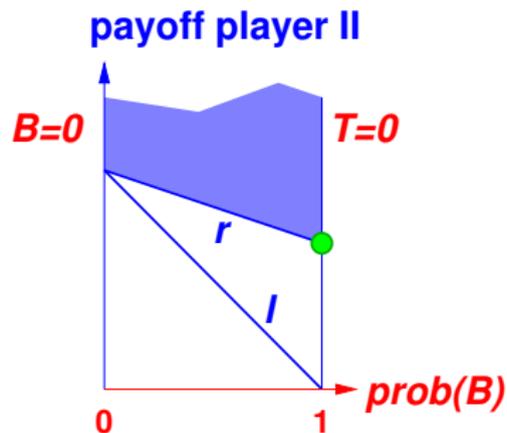

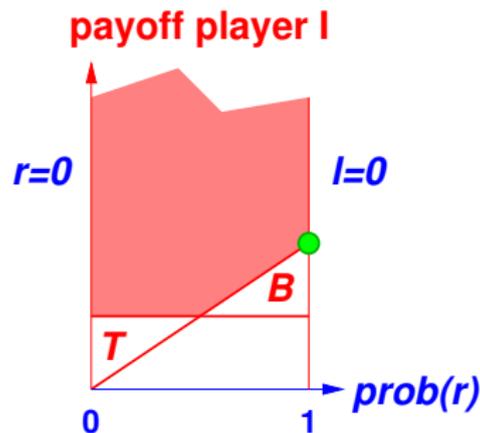

Label with best responses and unplayed strategies

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	1 3	1 3
	<i>B</i>	0 0	2 2

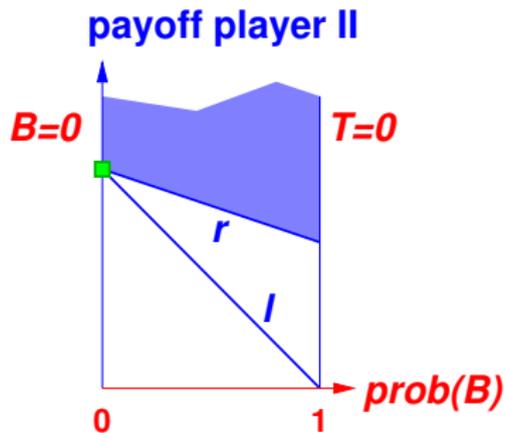

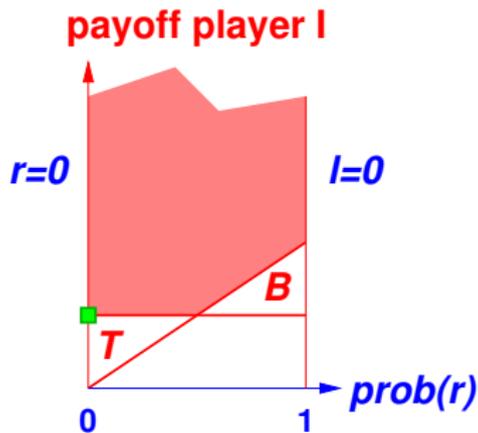

Equilibrium = **all** labels T , B , l , r present

		II	
		l	r
I	T	1 3	1 3
	B	0 0	2 2

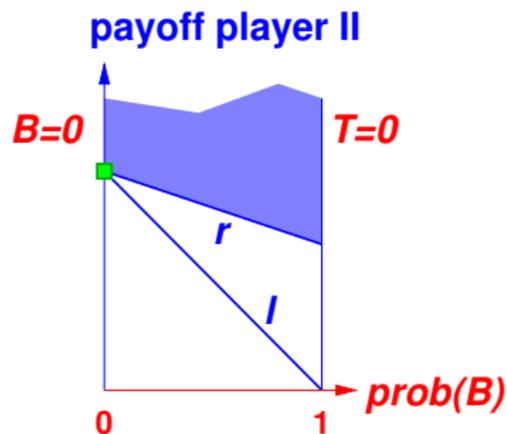

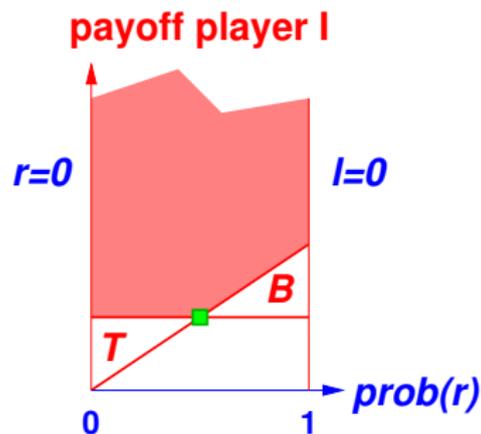

Equilibrium with multiple label r (degeneracy)

		II	
		l	r
I	T	<div style="display: inline-block; border: 1px solid green; padding: 2px;">■</div> <div style="display: inline-block; border: 1px solid blue; padding: 2px; margin-left: 10px;">3</div>	<div style="display: inline-block; border: 1px solid blue; padding: 2px; margin-left: 10px;">3</div>
	B	<div style="display: inline-block; border: 1px solid red; padding: 2px; margin-left: 10px;">1</div>	<div style="display: inline-block; border: 1px solid red; padding: 2px; margin-left: 10px;">2</div>

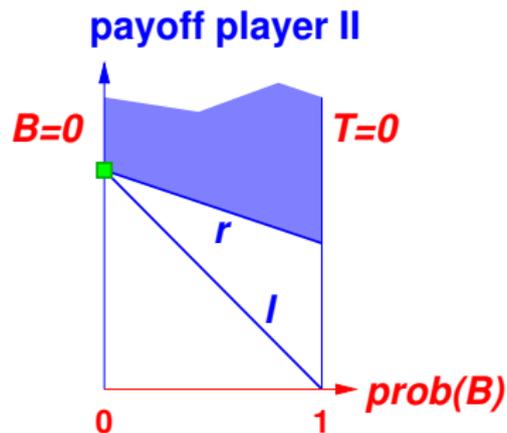

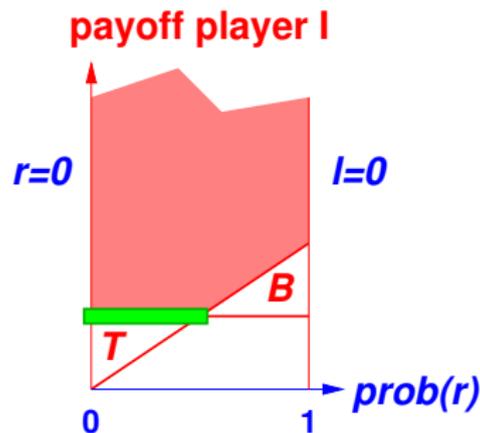

Equilibrium with multiple label B (degeneracy)

		II	
		<i>l</i>	<i>r</i>
I	<i>T</i>	1 3	1 3
	<i>B</i>	0 0	2 2

⇒ equilibrium component with labels T and B, l, r

		II	
		l	r
I	T	1 3	1 3
	B	0 0	2 2

Equilibrium components via cliques

In degenerate games (= vertices with zero basic variables, occur for game trees), get convex combinations of “exchangeable” equilibria. Recognized as **cliques** of matching vertex pairs:

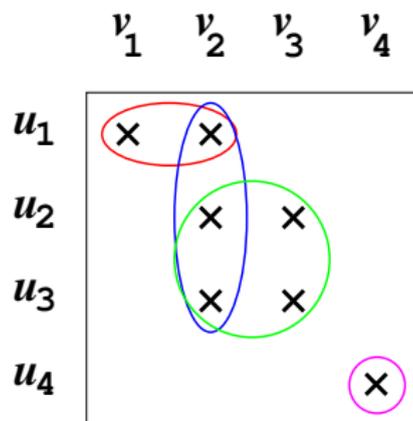

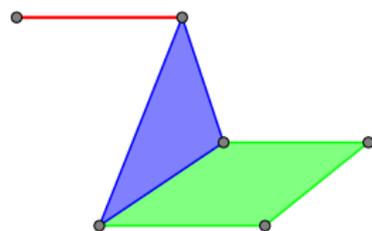

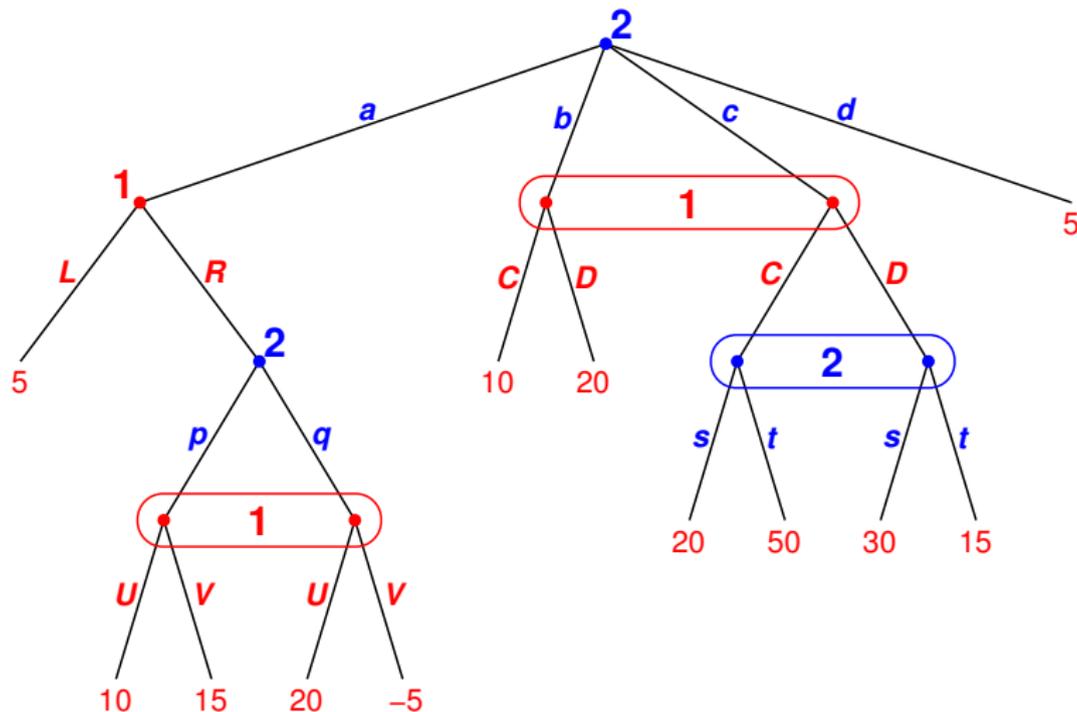

table of extreme equilibria

geometry

Algorithm: Sequence form for game trees

Example of game tree:

Exponentially large strategic form

Strategy of a player:

specifies a move for every information set of that player
(except for unspecified moves * at unreachable information sets)

⇒ **exponential** number of strategies

	<i>ap*</i>	<i>aq*</i>	<i>b**</i>	<i>c*s</i>	<i>c*t</i>	<i>d**</i>
<i>L*C</i>	5	5	10	20	50	5
<i>L*D</i>	5	5	20	30	15	5
<i>RUC</i>	10	20	10	20	50	5
<i>RUD</i>	10	20	20	30	15	5
<i>RVC</i>	15	-5	10	20	50	5
<i>RVD</i>	15	-5	20	30	15	5

Sequences instead of strategies

Sequence specifies moves only along **path** in game tree

⇒ **linear** number of sequences, sparse payoff matrix **A**

	\emptyset	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>ap</i>	<i>aq</i>	<i>cs</i>	<i>ct</i>
\emptyset					5				
<i>L</i>									
<i>R</i>									
<i>RU</i>						10	20		
<i>RV</i>						15	-5		
<i>C</i>			10					20	50
<i>D</i>			20					30	15

Expected payoff $\mathbf{x}^\top \mathbf{A} \mathbf{y}$, play **rows** with $\mathbf{x} \geq \mathbf{0}$ subject to $\mathbf{E} \mathbf{x} = \mathbf{e}$,
play **columns** with $\mathbf{y} \geq \mathbf{0}$ subject to $\mathbf{F} \mathbf{y} = \mathbf{f}$.

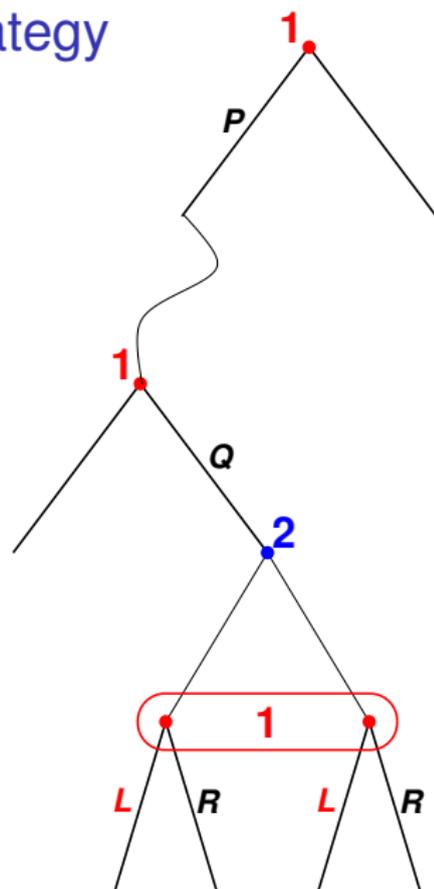

Play as behavior strategy

Given: $\mathbf{x} \geq \mathbf{0}$ with $\mathbf{E}\mathbf{x} = \mathbf{e}$.

Move L is last move of **unique** sequence, say PQL , where one row of $\mathbf{E}\mathbf{x} = \mathbf{e}$ says

$$x_{PQL} + x_{PQR} = x_{PQ}$$

$$\Rightarrow \text{behavior-probability}(L) = \frac{x_{PQL}}{x_{PQ}}$$

Play as behavior strategy

Given: $\mathbf{x} \geq \mathbf{0}$ with $\mathbf{E}\mathbf{x} = \mathbf{e}$.

Move L is last move of **unique** sequence, say PQL , where one row of $\mathbf{E}\mathbf{x} = \mathbf{e}$ says

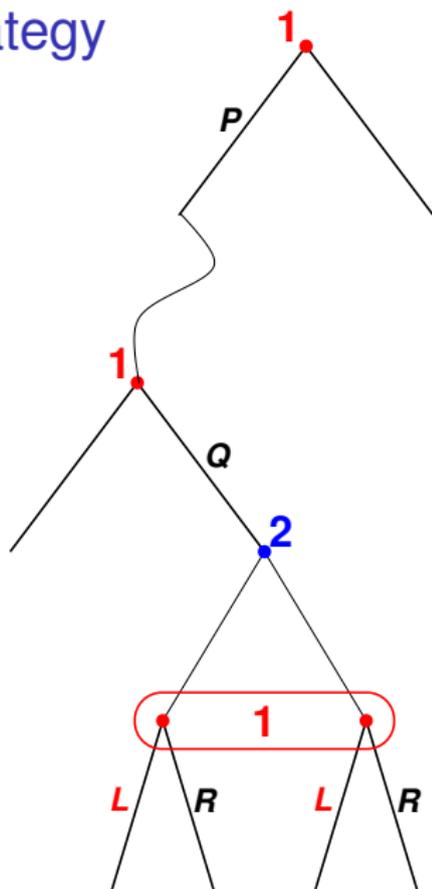

$$x_{PQL} + x_{PQR} = x_{PQ}$$

$$\Rightarrow \text{behavior-probability}(L) = \frac{x_{PQL}}{x_{PQ}}$$

Required assumption of **perfect recall**

[Kuhn 1953, Selten 1975]:

Each node in an information set is preceded by same sequence, here PQ , of the player's **own** earlier moves.

Linear-sized sequence form

Input: Two-person game tree with perfect recall.

Theorem [Romanovskii 1962, vS 1996]

The equilibria of a **zero-sum** game are the solutions to a Linear Program (LP) of **linear** size in the size of the game tree.

Linear-sized sequence form

Input: Two-person game tree with perfect recall.

Theorem [Romanovskii 1962, vS 1996]

The equilibria of a **zero-sum** game are the solutions to a Linear Program (LP) of **linear** size in the size of the game tree.

Theorem [Koller/Megiddo/vS 1996, vS/Elzen/Talman 2002]

The equilibria of a **non-zero-sum** game are the solutions to a Linear Complementarity Problem (LCP) of linear size.

A sample equilibrium is found by **Lemke's algorithm**.

This algorithm mimicks the Harsanyi–Selten tracing procedure and finds a normal-form perfect equilibrium.

Planned Extensions

Improve and convert GUI to pure JavaScript (Flash is phased out)

Further solution algorithms:

- **EEE** [Audet/Hansen/Jaumard/Savard 2001], needs exact arithmetic
- Path-following algorithms (Lemke-Howson, variants of Lemke)
- n -player games: simplicial subdivision, polynomial inequalities

Scripting features:

- connect with Gambit and Python
- database of reproducible computational experiments

Implementation challenges

Demonstrating that an algorithm works (for a publication)

- does not usually create robust and easy-to-use software

Implementation challenges

Demonstrating that an algorithm works (for a publication)

- does not usually create robust and easy-to-use software

Who should write such software?

- MSc thesis: not enough time
- PhD thesis / research grant: not scientific enough
- ideal: researcher creating “showcase” of their work

Example: **Rahul Savani's** <http://banach.lse.ac.uk/>

- student programmers with **Google Summer of Code**: insecure funding, but helps find **volunteer** open-source contributors.

Summary

GTE – Game theory explorer

- helps **create**, **draw**, and **analyze** game-theoretic models
- user-friendly, browser-based, low barriers to entry
- open-source, work in progress, needs contributors

https://github.com/gambitproject/gte/wiki/_pages

Summary

GTE – Game theory explorer
